Dear [COMPANY] Hiring Team,

I am applying for the [ROLE TITLE] position. [ONE SENTENCE: name the team, system, or engineering post at [COMPANY] your work maps to, and why. Delete this bracket text.]

For the past year I have run a self-hosted agentic platform as production infrastructure, and it has taught me where these systems actually break. Thirty-plus scheduled automations and email-triggered workers process real documents daily; every untrusted worker runs in a kernel-namespaces jail (bubblewrap) behind fail-closed permission gates, because the workers ingest third-party attachments while holding credentials, and prompt injection against that surface is a live threat, not a thought experiment. Cost circuit-breakers and typed error classification keep overnight runs from becoming billing storms. An autonomous pipeline builds and tests projects unattended and publishes only through a 12-check eval gate, with every refusal reason persisted to an audit log. None of this was assembled from a framework tutorial; each guardrail exists because the unguarded version failed in a specific way first.

The rest of my work points the same direction. At Mitsubishi HC Capital I shipped an AI document-validation service through formal IT intake and an architecture and security review panel; measured by a 50-package evaluation suite, it cuts review in a regulated environment from one to two hours to about a minute. My MEng research applies formal methods to LLM reliability: TLA+ and SMT2 specifications for a citation-faithfulness gating layer that checks whether generated study notes remain attributable to their sources. And through my studio I operate a payments platform solo, where money-handling code answers to 5,000+ automated tests.

Everything above is inspectable, and the architecture is documented publicly at suleyman.io/architecture. I would welcome the chance to bring this operating experience, and the scar tissue behind it, to [COMPANY].

Sincerely,

Suleyman Kiani
